What is Web and how it works?

- The web is a system for publishing pages of information on the internet, and for linking pages together using links. Anyone can publish a page by uploading it to a web server. Anyone can read that page by typing its address into a web browser.

How to become a web developer

With recent studies showing there is a significant - and growing - skills shortage across the digital sphere, it is imperative that this critical knowledge gap within the industry is addressed.

More traditional jobs are ceasing to exist, so training in an industry that is proliferating is the ideal way to ensure you are employed well into the future.

What does a web developer do?

- Also known as web programmers or web coders, web developers essentially make a website work by building the functionality, interactivity and visible structure of the site, normally based on the vision of designers and other key roles.
- Web developers are also responsible for ensuring a site functions correctly on all browsers - both desktop and mobile - through testing. Once a site is live, a developer carries out updates and other maintenance tasks as necessary.
